This field will be validated using GIS table. If the street name is not found in the table and it is validated that the street name exists the system will have an override capability to allow data entry to enter this street name. A notification process will need to be established to inform NDOT that a particular street name does not exist in their table. At data entry time, a drop down box will appear as the street name is entered, based on the characters. If the street name appears on the list, data entry would be able to click on that name instead of having to spell the entire name out. A secondary option will be given data entry, to search for the street name using a soundex routine. The soundexing would be done only on the main street name, i.e. Charleston not East Charleston. The soundex routine would not drop the first character of the name as it does with peoples names. This will allow data entry to locate a street name that may have been spelled incorrectly. The street name field will need to be stored in this system because the same street code may refer to different street names.
